ABSTRACT

Technology has advanced so much that the geographical gap is bridged with the use of tools that make you feel as if you are inside the classroom. E learning offers the ability to share material in all kinds of formats such as videos, pictures, word documents and PDF's. Conducting webinars (live online classes) and even participating in forums, message boards is also an option available to users.

Teaching and learning in 21st century is undergoing a rapid paradigm shift as there have been a great demand for the introduction of Mobile Technologies into the teaching and learning process. The study was geared towards investigation of secondary school teachers attitude and perception towards the use of mobile technology for instruction and learning. Survey research design was adopted. The sample comprised Seveny five teachers. A structured questionnaire was utilized in collecting data while percentage, mean and standard deviation were used to analyze the data collected. The results of the study indicated that secondary school teachers in Benue Local Government Area, Nigeria State only have access to few mobile technology facilities while the majority and most important ones were partially accessible. Also they had positive attitude and perception towards the use of mobile technology for teaching and learning. There was a significant difference on teachers attitude towards the use of mobile technologies for instruction based on their areas of specialization. No significant difference existed in the teachers perception on the use of mobile technologies for instruction based on their gender. It was therefore recommended that school promoters should provide adequate mobile technologies for the teachers as well as continuous training on the use of mobile technology for teaching in Kwaru State.

Keywords: Location-based Services; Positioning; Mobile Technologies

卷之三

ICT tools are being used extensively. They include magnifying lenses, cameras and software that can be used to zoom in on text, motion picture projectors, camcorders, video cameras, audio tape recorders, calculators, to mention a few. They also cover electronic equipment such as personal computers, hole-punches, hole books, file folders, paperclips, book marks, personal digital assistants, memory sticks, portable media players, video cameras, and many more (Anderson, 2010; Cottin, 2002; Macdonald & Franklin, 1999). ICTs have the potential to improve access to information and quality of education in developing countries.

It can be used to provide educational opportunities to people who previously had no access to education, such as confined and rural populations groups, especially underprivileged children because of cultural or social reasons, persons with disabilities and the elderly. This is possible because older technologies allow for mobile learning which is stimulated by a form of support in the delivery of education and its reception by learners (MUNOZ-GOMEZ, 2011). It is also possible using new technologies making it possible for more geographically dispersed learners to receive education anywhere. The Internet and the World Wide Web also provide access to learning material in almost every subject and in a variety of media anywhere in the world at the same time and to an unlimited number of people.

Abdullah, Ahmed and Pervaiz (2011) noted that internet and other emerging devices have gained much popularity in the field of education. These devices have been quickly adopted and are becoming mainstream staples of these technologies is mobile phones with software. There has been an exponential rise of technologies adding up to enhance the quality of education. New technologies are mainly advanced and being built up to improve

The process of learning and teaching. Some educators suggest that the use of mobile technologies allow in education and could have a particularly significant role to play in learning process accurately and effectively. Within the significance of modern mobile phones facilitate its users access to the web-based content. Hemmick, Shand & Courtney (2009) and others and their mediation abilities for the education. Mediated by mobile global audience (Alexander 2004; Perry 2009; Traxler 2009).

Mobiletech: refers to have a variety of educational settings for a several purposes and also a goal. While the claim about the positive impact of the use of mobile technologies in different aspects of education are based on how these technologies support for example the understanding of complex concepts or the development of skills that enable students to think and solve problems at limited times (Basmith & Madale 2009; Sharpley 2009). Mobile technology refers to any device that you can carry with you to perform a wide variety of "tasks". It's technology that allows those tasks to be performed on a mobile PDA, laptop, among others. A standard mobile technology has gone from being no more than a simple two-way pager to being a cellular phone, a GPS navigation system, a web browser, and instant messaging system, a video gaming system, and much more. It provides us the variety of transmission media such as radio wave, microwave, infrared, GPS and Bluetooth to allow for the transfer of data, voice, text, video, 2-dimensional graphics and more (Gaiachend, n.d.).

During the past few years there have been tremendous strides in the advancement of technology with the use of mobile technology leading to a characteristic by the instant access to the mobility of information. Mobile technologies such as cellular phones, personal audio players, personal digital assistants and portable computers have reshaped and redefined the ways in which information is constructed, accessed and communicated among individuals and societies. As these mobile devices become more widespread, opportunities more prevalent, remarkable learning possibilities are offered and profound innovative learning possibilities are now made feasible (Kukulska-Hume 2005).

We are beginning to see significant influence of these technologies in secondary and higher education within individual and the communities and in teaching and learning. They are having an impact on teaching, learning and on the connectivity between formal and informal learning. Researchers have argued that these technologies have the potential to improve efficiency and effectiveness on teaching and learning and to challenge the essence of face-to-face teaching and learning (Dubendorff 2003; Kukulska Hume 2005). In examining the benefits of mobile technologies in education Kim, Mims, and Holmes (2008) emphasize as follows mobility which is associated with the advantage of accessing information anywhere, anywhere information management capacity which is associated with the digitization of information and electronic based

management and learning which will have the effect of increasing student motivation and enjoyment (Hargitt & Hargitt, 2002).

We live in the midst of a global technology boom that has in the words of Freedman (2007) transformed the world. Because of the flattened connectivity in people's places all over the world, students can now communicate with people in other places all over the world. Students can now easily get instant information about happenings all over the world, whether it be traffic simply relying on a device that was invented 10-15 years ago, or young people having the ability of manipulating technology that no one could have imagined. In India, have learnt how to type surpasses the knowledge of most adults. In India, have learnt how to type papers while listening to MP3 players and at the same time send text messages to friends on their cell phones. Many students have been exposed to this technology at a very early age. Secondly school administrators now face the challenges of students using technologies to record assembly, deal with difficult situations in their classrooms. These recordings can either be posted on Social Applications like YouTube Face book and MySpace or simply uploaded on the press. (Fack & Juhu et al., 2008).

Mobile technologies are being used in the classroom and in distance education to teach out to students in order to deliver learning materials to students. Teachers can record their lectures and make them available for students to listen whenever they like. Providing teaching and learning material like in audio formats, important because some subjects such as English literature. The mobile technologies are also used to connect to students to information when subjects requirements are due and informing them on updates to each subjects. Mobile technologies can be used in any discipline that can be broken down into small components of instruction (Ally & Li, 2005). Hence we allow students to learn one subject at a time in addition to playing a supportive role in classroom instruction. mobile technologies can play a major role in distance education by delivering instruction anywhere and at any time. Books and course material would have to be formatted on the mobile devices and mobile devices screens. A good example of how this is being realized is the screen on the One Hundred dollar laptop (One Laptop Per Child, 2008). Information on the screen can be read in daylight as well as in the dark. The small screens of the mobile technologies are being made more advanced for reading. As with the development of the virtual screen, students will be able to project information and images on a surface that is the same size as a regular computer screen (Ally & Li, 2005). Because of the feature of portability mobile technologies offer continuous accessibility to learners who can view the learning resources or take subjects conveniently.

Mobile technologies are increasingly equipped with capabilities that can communicate easily with each other through radio waves or Wi-Fi rather than traditional cables or wires. Consequently learners can easily share information across network resources or interact with others. The wireless feature enables learners to keep contact with each other no matter the distance. As a result,

collaboration learning is more likely to occur with the substance of technology (Gillenwater 2009). Mobile devices can have a positive effect on how teachers and students learn. The ability to utilize them successfully in the design of online class, it has can impact the effectiveness of teaching and learning by giving them options for learners to connect with course content as well as to other learners (Datalic et al., 2010).

Perception is probably often the first step in learning. It is important to have a unified view of the world with the present situation based on incomplete and unstructured information. Perception is essential for most practical purposes and guides human behaviour. In general perception can be seen as a way of understanding human attributing psychological reality to process or use information received. Perception is an act of producing cognizance in the mind of what is committed to them outside through human cognition (Fager 2018). Perception has been reported to depend heavily on the background knowledge (Daramola 2018).

Literature have established a strong connection between individual perception and ability to take up a particular course of action. The individual's individual perception is that of reaction or response whether overt or covert which is usually if perception is to be considered a behavioural event and thus a psychological process. As a result of perception an employee may move rapidly or slowly at develop an attitude toward an object (Luthans 1998). Some other perception is higher reality. Perception in communication determines how one will communicate and how they will receive information from another person. Perception in communication, just as in other fields of research.

Gender is a factor in every aspect of human endeavour and has an important all across the globe. Mobile technologies refer to those new discoveries and new ways of doing things in a different perspective. Gender and mobile technologies can be said to mean gender relation (man or woman) as they react to the existence or disappearance of new technologies in the improvement of teaching and learning (Owusu 2009). Olatumola (2011) refers to gender as a socialised attribute and opportunity is associated with being male and female. The mutual relationship which is constructed and learned through socialization process and technology has a striking nature to meet their need. Studies over the years have suggested that there is a declining gender gap between males and females with females taking behind their male peers in the use of computers and other

Conclusion of the Problem

Mobile technologies are not the only effective teaching tools for delivery in the classroom. The application of mobile devices for particularly in Nigeria secondary school is still at its infancy. The use of Nigerian secondary school teachers are neither familiar nor skilled in

employing these tools for instruction in the classroom. It is of high importance that the traditional teaching method should be supplemented with mobile devices which can stimulate students' interest to learn effectively; which will greatly influence their academic performance positively and successfully. The delivery of instructions in the classroom. Most Nigerian secondary school teachers and students, with possession of these mobile devices utilize them for entertainment purposes listening to music, chatting on social media sites which may not have any positive impact on both the teacher and the learner.

In Nigeria secondary schools much has not been done in employing mobile devices as instructional tools to fruition. To the best knowledge of the researcher, there is dearth of works on how mobile devices can be utilized for instruction and how it can affect student learning rate. In the light of this, this study attempts to investigate the attitude and perception of secondary school teachers towards the use of mobile technological devices for instruction in Kogi State.

Methodology

A descriptive research design was adopted for this study. It was targeted at secondary school teachers' attitude and perception towards the use of mobile technologies for instruction in Kogi State. This method was selected due to its appropriate design for the study because it involves collecting a chosen sample from a large population. The target population for the study comprised of 100 teachers in the selected secondary schools throughout Local Government Areas in Kogi State. However, 20 secondary schools were purposively selected to study 20 teachers who taught randomly from 5 selected Secondary Schools. While gender ratio 4:1 was used to classify the teachers based on their gender attitudes or perception. The questionnaire was validated by three experts from the Department of Educational Technology, Faculty of Education, UNIZIK, Enugu, Nigeria. The experts made necessary corrections and suggestions which were used in the preparation of the final draft of instrument. The revised instrument was tested to validity and reliability methods. The researcher personally administered the questionnaire to the respondents and was able to review 79 them. 75% of the questionnaires from the respondents 26 part is 225 of the respondent were descriptive and inferential statistics in analyzing Data. Descriptive statistics such as mean, percentage, mean standard deviation were employed to know the way students' attitude towards mobile devices used to test hypothesis 1 and Research Questions.

The following research questions were used to guide this study:

- 1 How do secondary school teachers perceive the usefulness of mobile technologies for instruction?
- 2 How do secondary school teachers perceive the usefulness of mobile technologies for instruction?
- 3 What motivates secondary school teachers to use mobile technologies for instruction?

Research hypotheses

Based on the research question the following hypotheses were tested:

- H₀₁: There is no significant difference between male and female teachers' participation in the use of mobile technologies for instruction.
- H₀₂: There is no significant difference between male and female secondary school teachers' attitude towards the use of mobile technologies for instruction.

Analysis of Research Questions

Research Question 1: What is the perception of secondary school teachers on the use of mobile technology for instruction?

Table 1: Perception of Secondary School Teachers on the use of Mobile Technology for Instruction

S/N	Items	SAT(S)	AGT(M)	OPO(D)	SO(S)
1	Teachers see the use of mobile technologies as a positive measure for their learning environment.	30%	82%	12%	6%
2	Teachers lack of interest in the use of mobile technologies.	29%	22%	56%	12%
	Mobile technology removes all impediments to effective teaching and learning.	42%	20%	38%	10%

4. Teachers believe that mobile devices have definitely contributed to the failure of secondary school students.

5. Good question (and evaluation cannot be effectively access in the use of mobile devices)

Table 4 reveals that, on average, teachers believe that the use of mobile technology has positive influence on their teaching profession with 84 respondents reporting 84%, agreed and 18 respondents reporting 15% disagree. Majority of the respondents agree that the use of mobile technology by secondary school teachers has positive influence on their teaching profession. Teachers teacher influence if the use of mobile technology, is also an addition that affords the use of mobile technology with 30% agree while 70 and 7.3% disagree. Mobile technologies are an impediment to effective teaching and learning, with 45% respondents agree and 55% disagree.

Research Question 2: What is the gender's influence upon perceived usefulness of mobile technologies?

Table 2: Teachers' Perception toward the Use of Mobile Technology Based on Gender

Gender	N	Mean	SD
Male	52	20.52	2.62
Female	48	18.33	4.85

Table 5 shows the mean scores of secondary school teachers' perception towards the use of mobile technology. Male teachers ($M = 20.52$, $SD = 2.62$) and female teachers ($M = 18.33$, $SD = 4.85$) are different. Hence there was a difference between male and female teachers' perception towards the use of mobile technology. The difference is in the direction of the male teachers' perception towards the use of mobile technology.

Research Question 3: What is the utility of secondary school teachers on the use of mobile technologies in the secondary schools?

Table 3: Attitudes of Secondary School Teachers on the use of mobile technologies

0% 10% 20% 30%

34	Want to be someone like me, the new model of mobile banking	14%	30%	33%
35	Want to be someone like me, the new model of mobile banking	14%	30%	33%
36	Want to be someone like me, the new model of mobile banking	14%	30%	33%
37	Want to be someone like me, the new model of mobile banking	14%	30%	33%
38	Want to be someone like me, the new model of mobile banking	14%	30%	33%
39	Want to be someone like me, the new model of mobile banking	14%	30%	33%
40	Want to be someone like me, the new model of mobile banking	14%	30%	33%
41	Want to be someone like me, the new model of mobile banking	14%	30%	33%
42	Want to be someone like me, the new model of mobile banking	14%	30%	33%
43	Want to be someone like me, the new model of mobile banking	14%	30%	33%
44	Want to be someone like me, the new model of mobile banking	14%	30%	33%
45	Want to be someone like me, the new model of mobile banking	14%	30%	33%
46	Want to be someone like me, the new model of mobile banking	14%	30%	33%
47	Want to be someone like me, the new model of mobile banking	14%	30%	33%
48	Want to be someone like me, the new model of mobile banking	14%	30%	33%
49	Want to be someone like me, the new model of mobile banking	14%	30%	33%
50	Want to be someone like me, the new model of mobile banking	14%	30%	33%

Table 2 reveals that the new model of mobile banking has been adopted by 30% of the respondents. This is consistent with the findings of previous studies that the use of mobile banking services is increasing rapidly. Mobile banking has been adopted by 30% of the respondents while 42% are using mobile banking services. Mobile banking services are adopted by 30% of the respondents while 42% of the respondents are not using mobile banking services.

Testing

- There is no significant difference between male and female users in their use of mobile banking services.

Table 1 reveals that $F(1, 1) = 9.43$, $p = .29$. This means that the null hypothesis was not rejected. This was as a result of value of 9.43 resulting in 0.29 which is significant values greater than 0.05 alpha levels. By implication the stated hypothesis established that there was no significant difference between teachers' attitude towards the use of mobile technologies based on their gender.

Hypothesis 2 There is no significant difference in secondary school teachers' attitude towards the use of mobile technologies in instruction

Table 4 Teachers' Attitude Towards the Use of Mobile Technologies for Instruction Based on their Area of Gender

	Sum of Squares	df	Mean Square	F	Sig.	Remark
Between Groups	211.6312	25	77.927			
				2.111	0.12	Rejected
Total	17553.76	48	361.109			

Table 2 reveals that $F(2, 48) = 2.321$, $p = .193$. As Teachers' Attitudes towards the Use of Mobile Technologies for Teaching based on their Area of Instruction. This was found to be significant meaning that there was significant difference in the teachers' attitude towards the use of mobile technologies in teaching. Since $p < 0.05$ it is assumed that there was significant difference of the teachers' attitude towards the use of mobile technologies in three areas of instruction. Therefore the null hypothesis which stated that there is no significant difference in Teachers' Attitudes on the use of mobile technologies based on the area of instruction is rejected.

Discussion of Findings

The study revealed that teachers' attitude and perception towards the use of mobile technologies in academic outcome was positive and teachers' had positive towards these facilities with an influence learning materials.

Further implies that for the secondary school teachers to use mobile technologies for teaching there is a need for an improvement in their level of teaching ICT skills possessed by them so as to align more learning materials intended for all teachers to this as it is so because the use of mobile devices for teaching at the class of specialization and their compatibility with the teaching will the rate of adopting technology use.

Furthermore significant difference was found between male and female teachers' attitude towards the use of Mobile Technologies. This implies that Secondary School Teachers gender has influence on their attitude and in the use of mobile technologies for teaching.

Conclusion

This study of Mobile Technologies changed teaching in several ways. The first is explored teachers' attitude and perception in the use of mobile technologies for teaching in International Gothic ninth year, Kenya. Study

The result obtained from the findings analyzed in this study indicates that the responses of 107 of the teachers are positively moderate. There was no significant difference in the teachers' perception on the use of mobile technologies for teaching based on gender. Finally there was a significant difference between Secondary Schools Teachers' Attitudes on the Use of Mobile Technologies for Teaching based on gender. The result of this study could enhance the use of mobile technologies for teaching in Nigeria secondary schools.
